

DAP + STRETCHY BELT

Our Decoupling Alternator Pulley (DAP) used with our Stretchy Belt to transfer power from the engine to parts in the front-end of the transmission. Thanks to our solution, you can now remove one or more idlers as well as the automatic tensioner, streamlining the front-end of the transmission.

Our solution reduces vibrations in the front of the transmission, decreases dynamic tension on the belt, and prevents the belt from sliding in the pulleys and the strands from fluttering. It also optimizes the belt's operating tension. Reduced energy loss due to frictions results in CO2 emissions savings. By virtue of eliminating pulleys, idlers and automatic tensioners, assembly time becomes faster and costs are reduced.

Our expertise in designing accessories for power transmissions has allowed us to optimize the entire system and then design the DAP and Stretchy Belt for any type of application.

- Products Family: **EPDM Belts; DAP**

TECHNICAL FEATURES

- Large selection compatible with alternators ranging from 90 to 250 amps.
- Includes a torsion spring specially designed to significantly reduce vibrations and withstand heavy loads.
- Reduces the weight of the front-end of the transmission by up to 1.1 kilograms.

BENEFITS

- Lightweight
- Comfort
- Cost-Effective
- Energy Efficiency
- Easy Assembly

MARKET AND EXPERTISE

AUTOMOTIVE & TRUCKS

Belt Drive Systems

ALL PRODUCTS FAMILIES

Automotive Belt Drive Systems

EPDM Belts

They transmit power from the motor to all power transmission accessories. They resist both to high and low temperatures, dynamic loads on the front-end of the transmission and abrasion. They offer outstanding acoustic performance.

Thermoset Pulleys

They decrease inertia and, as a result, reduce vibration levels. Adapted to any types of accessory water pumps, power steering pumps and air conditioning compressors, cranshaft.

Hydraulic Belt Tensioners

They reduce vibrations in the front-end of the transmission and optimize belt tension, extending the lifespan of the Poly V® belt life cycle. They're particularly well suited for applications with a high dynamic behavior.

Decoupling Alternator Pulleys (DAP)

They improve vibratory performance of the power transmission, decrease dynamic tension in the belt, and prevent the belt from sliding on the pulleys and the strands from fluttering. They also optimize the belt operating tension.
